WHAT IS CLAIMED IS:

1. A method for extending the survival of an organ transplant in a recipient, said method comprising:

contacting cells of an organ transplant with a nucleic acid that modulates heme oxygenase-I activity in said cells, whereby the survival time of said organ transplant is extended.

- 2. The method according to Claim 1, wherein said nucleic acid molecule encodes a polypeptide having heme oxygenase-I activity.
- 3. The method according to <u>Claim</u> 2, wherein said nucleic acid has at least about 80° o sequence identity to nucleotides 81-944 of the human heme oxygenase-I nucleic acid sequence shown in Figure 3 (SEQ ID NO:1).
 - The method according to Claim 2, wherein said nucleic acid comprises nucleotides 81-944 of the human heme oxygenase-I nucleic acid sequence shown in Figure 3 (SEQ ID NO:1).
 - 5. The method according to Claim 1, wherein said contacting is ex vivo.
 - 6. The method according to Claim 1, wherein said contacting is *in vivo*.
 - 7. The method according to Claim 1, wherein said organ transplant is an allograft.
 - 8. The method according to Claim 7, wherein said allograft is a heart.
 - 9. The method according to Claim 1, wherein said contacting is with a liposome-mediated nucleic acid transfer vehicle.
 - The method according to <u>Claim 1</u>, wherein said contacting is with a viral-mediated nucleic acid transfer vehicle.

- 11. The method according to Claim 1, wherein said contacting is accomplished by direct injection of said nucleic acid into said organ.
- 12. The method according to Claim 1, wherein the heme oxygenase-I activity in said cells is increased.
- 13. A method for extending the survival of an organ transplant in a recipient, said method comprising:

15

contacting cells of said organ transplant with a nucleic acid encoding a polypeptide having heme oxygenase-I activity, wherein said nucleic acid molecule is expressed in said cells in an amount sufficient to increase heme oxygenase-I activity therein, whereby the survival time of said transplant is extended.

- 14. The method according to Claim 13, wherein said nucleic acid molecule has at least about 80% sequence identity to nucleotides 81-944 of the human heme oxygenase-I nucleic acid sequence shown in Figure 3 (SEQ ID NO:1).
- 15. The method according to <u>Claim 13</u>, wherein said nucleic acid molecule comprises nucleotides 81-944 of the human heme oxygenase-I nucleic acid sequence shown in Figure 3 (SEQ ID NO:1).
 - 16. The method according to Claim 13, wherein said contacting is ex vivo.
 - 17. The method according to Claim 13, wherein said contacting is in vivo.
- 20 18. The method according to Claim 13, wherein said organ transplant is an allograft.
 - 19. The method according to Claim 18, wherein said allograft is a heart.
 - 20. The method according to Claim 13, wherein said contacting is with a liposome-mediated nucleic acid transfer vehicle.

- 21. The method according to <u>Claim</u> 13, wherein said contacting is with a viral-mediated nucleic acid transfer vehicle.
- 22. The method according to Claim 13, wherein said contacting is accomplished by direct injection of said nucleic acid molecule into said organ.
 - 23. A liposome comprising a nucleic acid encoding a heme oxygenase.
 - 24. A viral vector comprising a nucleic acid encoding a heme oxygenase.
- 25. The viral vector of Claim 24, wherein said viral vector is an adenoviral vector.
